Paper 1

For examination from 2021

SPECIMEN PAPER

2 hours 15 minutes

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your centre number, index number and name in the spaces at the top of this page.
Write in dark blue or black pen.
You may use an HB pencil for any diagrams or graphs.
Do not use staples, paper clips, glue or correction fluid.
DO **NOT** WRITE ON ANY BARCODES.

Answer **all** the questions.
Give non-exact numerical answers correct to 3 significant figures, or 1 decimal place in the case of angles in degrees, unless a different level of accuracy is specified in the question.
The use of an approved scientific calculator is expected, where appropriate.
You are reminded of the need for clear presentation in your answers.

The number of marks is given in brackets [ ] at the end of each question or part question.

The total number of marks for this paper is 90.

1. ALGEBRA

Quadratic Equation

For the equation $ax^2 + bx + c = 0$,

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Binomial expansion

$$(a + b)^n = a^n + \binom{n}{1}a^{n-1}b + \binom{n}{2}a^{n-2}b^2 + \ldots + \binom{n}{r}a^{n-r}b^r + \ldots + b^n,$$

where n is a positive integer and $\binom{n}{r} = \frac{n!}{r!\,(n-r)!} = \frac{n(n-1)\ldots(n-r+1)}{r!}$

2. TRIGONOMETRY

Identities

$$\sin^2 A + \cos^2 A = 1$$

$$\sec^2 A = 1 + \tan^2 A$$

$$\operatorname{cosec}^2 A = 1 + \cot^2 A$$

$$\sin(A \pm B) = \sin A \cos B \pm \cos A \sin B$$

$$\cos(A \pm B) = \cos A \cos B \mp \sin A \sin B$$

$$\tan(A \pm B) = \frac{\tan A \pm \tan B}{1 \mp \tan A \tan B}$$

$$\sin 2A = 2 \sin A \cos A$$

$$\cos 2A = \cos^2 A - \sin^2 A = 2\cos^2 A - 1 = 1 - 2\sin^2 A$$

$$\tan 2A = \frac{2 \tan A}{1 - \tan^2 A}$$

Formulae for $\triangle ABC$

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

$$a^2 = b^2 + c^2 - 2bc \cos A$$

$$\Delta = \frac{1}{2} bc \sin A$$

1 The line $\frac{x}{a} + \frac{y}{b} = 1$, where a and b are positive constants, intersects the x-axis at S and the y-axis at T.

Given that the gradient of ST is $-\frac{1}{3}$ and that the distance $ST = \sqrt{40}$, find the value of a and of b. [5]

$$\frac{y}{b} = \frac{-x}{a} + 1$$

$$y = \frac{-b}{a}x + b$$

since gradient $= -\frac{1}{3}$

$$\frac{b}{a} = \frac{1}{3}$$

$$a = 3b \quad ——— ①$$

To find T: let $x = 0$,

$$y = b$$

$$\therefore T = (0, b)$$

To find S: let $y = 0$,

$$\frac{x}{a} = 1$$

$$x = a$$

$$\therefore S = (a, 0)$$

Length of $ST = \sqrt{b^2 + a^2} = \sqrt{40}$
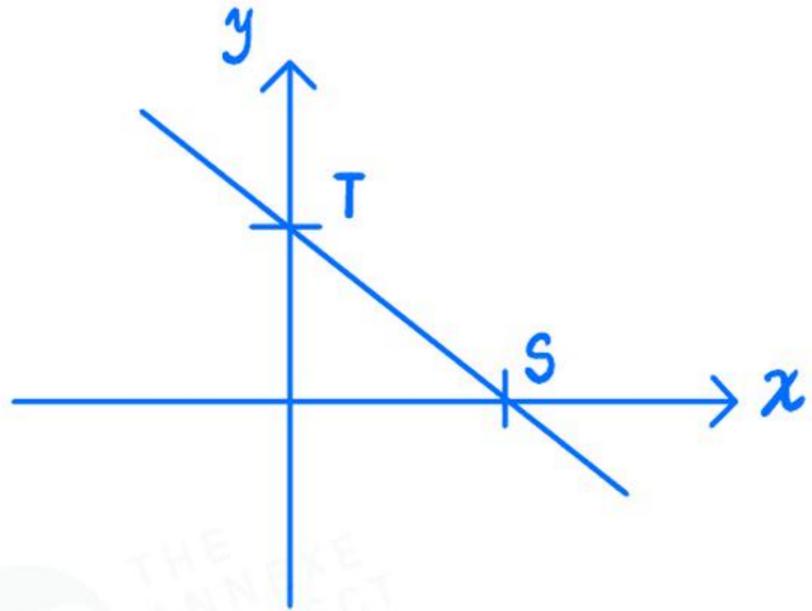

$$\therefore a^2 + b^2 = 40 \quad ——— ②$$

Sub ① into ②:

$$(3b)^2 + b^2 = 40$$

$$10b^2 = 40$$

$$b^2 = 4$$

$$\underline{b = 2} \text{ (since } b > 0)$$

since $a = 3b$,

$$\underline{a = 6}$$

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

2 The equation of a curve is $y = 3 - 4\sin 2x$.

  (a) State the minimum and maximum values of y.   [2]

  (b) Sketch the graph of $y = 3 - 4\sin 2x$ for $0° \leqslant x \leqslant 360°$.   [3]

(a). $-1 \leqslant \sin 2x \leqslant 1$

 $\therefore$ $-4 \leqslant -4\sin 2x \leqslant 4$

   $-4 + 3 \leqslant 3 - 4\sin 2x \leqslant 4 + 3$

   $-1 \leqslant 3 - 4\sin 2x \leqslant 7$

Hence, $\underline{\text{min} \cdot y = -1}$ and $\underline{\text{max} \cdot y = 7}$

(b).
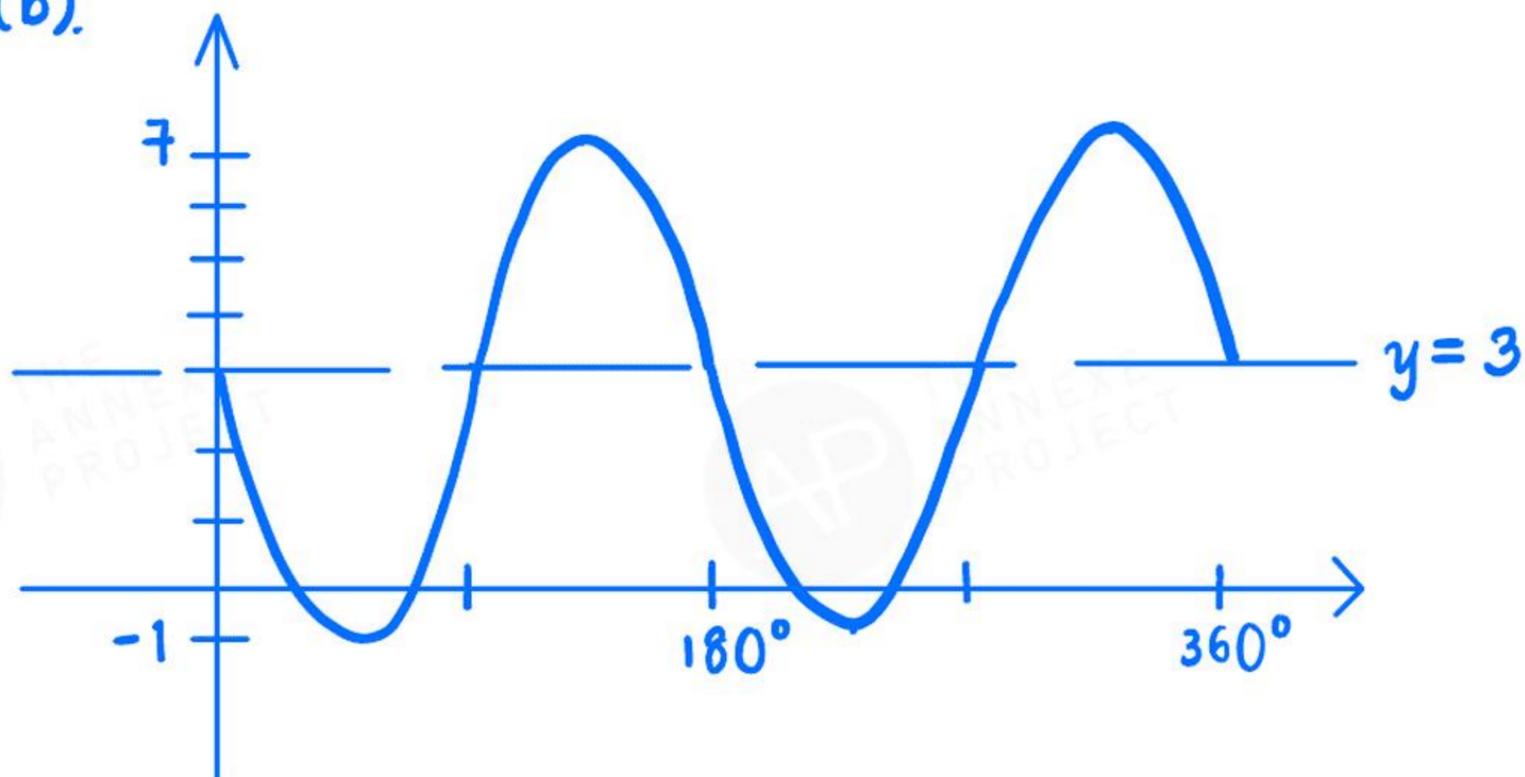

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

3 **(a)** Find the first 3 terms in the expansion, in ascending powers of x, of $\left(2-\dfrac{x}{4}\right)^6$. Give the terms in their simplest form. [3]

$$\left(2-\frac{x}{4}\right)^6 = 2^6 + 6(2^5)\left(-\frac{x}{4}\right) + 15(2^4)\left(-\frac{x}{4}\right)^2 + \cdots$$
$$= 64 - 48x + 15x^2 - \cdots$$

(b) Hence find the term independent of x in the expansion of $\left(2-\dfrac{x}{4}\right)^6\left(\dfrac{3}{x}-x\right)^2$. [3]

$$\left(2-\frac{x}{4}\right)^6\left(\frac{3}{x}-x\right)^2 = (64-48x+15x^2-\cdots)\left(\frac{9}{x^2}-6+x^2\right)$$

Hence, independent term $= (64 \times -6) + (15 \times 9)$
$$= -249$$

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

4 The function f is defined by $f(x) = \dfrac{x^2 - 4}{x^2 + 6}, x > 0$.

(a) Explain, with working, whether f is an increasing or a decreasing function. [4]

$$f'(x) = \frac{(x^2 + 6)(2x) - (x^2 - 4)(2x)}{(x^2 + 6)^2}$$

$$= \frac{2x^3 + 12x - 2x^3 + 8x}{(x^2 + 6)^2}$$

$$= \frac{20x}{(x^2 + 6)^2}$$

When $x > 0$, $20x > 0$ and $(x^2 + 6)^2 > 0$, hence $f'(x) > 0$ when $x > 0$.

$\therefore$ f is an <u>increasing function</u> when $x > 0$.

(b) A point P moves along the curve $y = f(x)$ in such a way that the y-coordinate of P is increasing at a rate of 0.05 units per second. Find the rate of increase of the x-coordinate of P when $x = 2$. [2]

Given: $\dfrac{dy}{dt} = 0.05$ units/s

Find: $\dfrac{dx}{dt}$ when $x = 2$.

$$\frac{dy}{dt} = \frac{dy}{dx} \cdot \frac{dx}{dt}$$

$$0.05 = \frac{20(2)}{(2^2 + 6)^2} \cdot \frac{dx}{dt}$$

$\therefore \dfrac{dx}{dt} = \underline{0.125 \text{ units/s}}$

5   On a certain date, 160 cases of influenza were recorded in a city. This number increased with time and after t days the number of recorded cases was N. It is believed that N can be modelled by the formula $N = 160e^{kt}$. The number of cases recorded after 5 days was 245.

(a)   Estimate the number of cases recorded after 7 days.   [4]

$$N = 160 \, e^{kt}$$

given $N = 245$ when $t = 5$ days,

$$245 = 160 \, e^{5K}$$

$$e^{5K} = \frac{49}{32}$$

$$5K = \ln \frac{49}{32}$$

$$K = \frac{1}{5} \ln \frac{49}{32} \quad \text{or} \quad 0.085217$$

Hence, $N = 160 \, e^{\left(\frac{1}{5} \ln \frac{49}{32}\right)t}$

when $t = 7$, $N = 290.53$

$$= \underline{291}$$

Influenza is declared an epidemic when the number of cases reaches 400.

(b)   Estimate after how many days influenza is declared an epidemic.   [2]

$$400 = 160 \, e^{\left(\frac{1}{5} \ln \frac{49}{32}\right)t}$$

$$\frac{5}{2} = e^{\frac{1}{5} \ln \frac{49}{32} t}$$

$$\ln 2 \cdot 5 = \left(\frac{1}{5} \ln \frac{49}{32}\right)t$$

$$\therefore t = 10.752$$

$$= 10.8$$

An epidemic is declared after <u>11 days</u>.

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

6 For a particular curve $\dfrac{d^2y}{dx^2} = 3\cos x - 4\sin 2x$. The curve passes through the point $P\left(\dfrac{\pi}{2}, 9\right)$ and the gradient of the curve at P is 5. Find the equation of the curve. [6]

$$\frac{d^2y}{dx^2} = 3\cos x - 4\sin 2x$$

Integrate both sides w.r.t. x :

$$\frac{dy}{dx} = \int 3\cos x - 4\sin 2x \; dx$$

$$= 3\sin x + \frac{4\cos 2x}{2} + C$$

$$= 3\sin x + 2\cos 2x + C$$

Given $\dfrac{dy}{dx} = 5$ when $x = \dfrac{\pi}{2}$:

$$\therefore 5 = 3\sin\frac{\pi}{2} + 2\cos\pi + C$$

$$5 = 3 - 2 + C$$

$$C = 4$$

Hence, $\dfrac{dy}{dx} = 3\sin x + 2\cos 2x + 4$

Integrate both sides w.r.t. x :

$$y = \int 3\sin x + 2\cos 2x + 4 \; dx$$

$$= -3\cos x + \frac{2\sin 2x}{2} + 4x + D$$

$$= -3\cos x + \sin 2x + 4x + D$$

Given $x = \dfrac{\pi}{2}$, $y = 9$:

$$\therefore 9 = -3\cos\frac{\pi}{2} + \sin\pi + \frac{4\pi}{2} + D$$

$$9 = 2\pi + D$$

$$D = 9 - 2\pi$$

Hence, $\underline{y = -3\cos x + \sin 2x + 4x + 9 - 2\pi}$

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

7 **(a)** Express each of $2x^2 - 4x + 5$ and $-x^2 - 4x - 2$ in the form $a(x + b)^2 + c$, where a, b and c are constants. [4]

$$2x^2 - 4x + 5 = 2\left(x^2 - 2x + \frac{5}{2}\right)$$
$$= 2\left[(x-1)^2 - 1^2 + \frac{5}{2}\right]$$
$$= \underline{2(x-1)^2 + 3}$$
$$-x^2 - 4x - 2 = -(x^2 + 4x + 2)$$
$$= -\left[(x+2)^2 - 2^2 + 2\right]$$
$$= \underline{-(x+2)^2 + 2}$$

(b) Use your answers from part **(a)** to explain why the curves with equations $y = 2x^2 - 4x + 5$ and $y = -x^2 - 4x - 2$ will not intersect. [3]
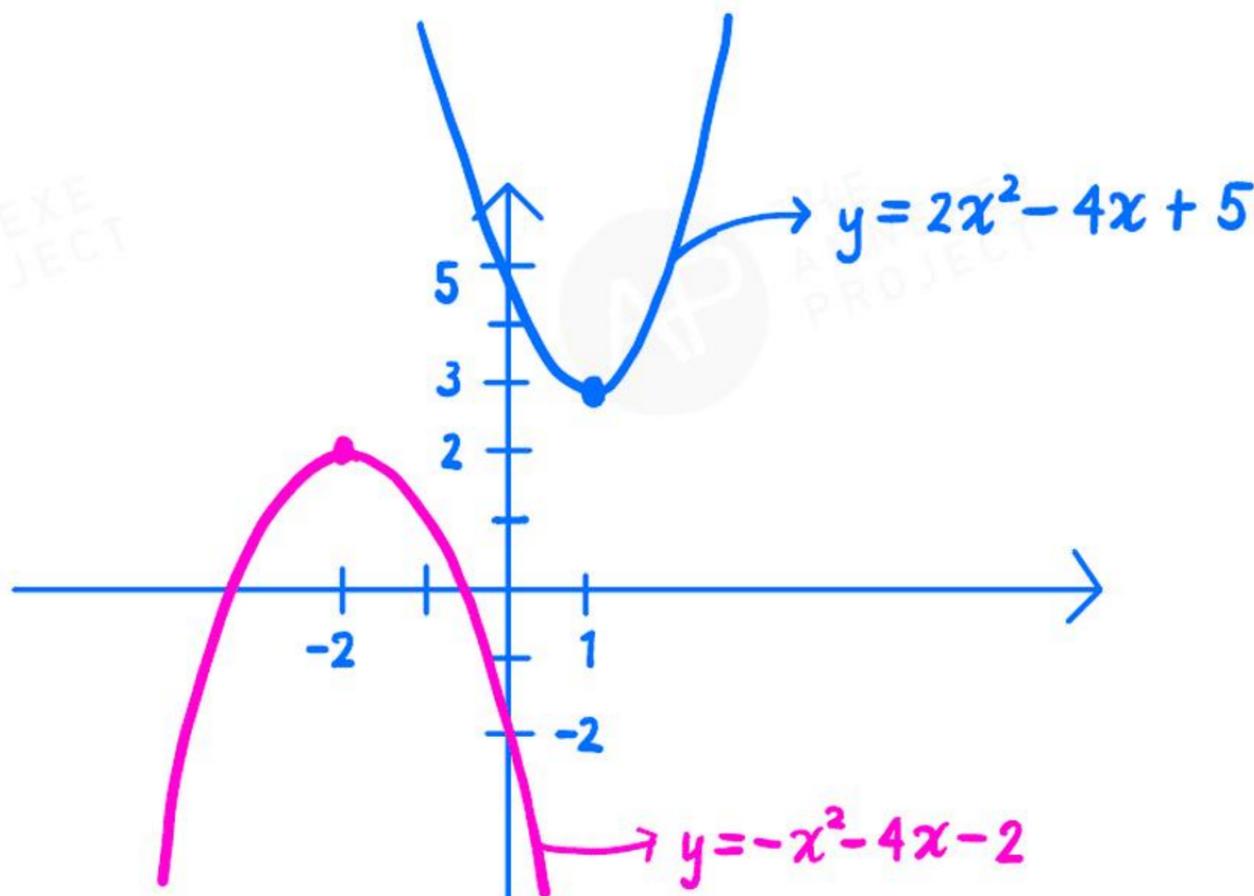

$y = 2x^2 - 4x + 5$ is a minimum curve with y min. $= 3$, while $y = -x^2 - 4x - 2$ is a maximum curve with y max. $= 2$. Hence, the 2 curves will not not intersect as shown above.

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

8   **Without using a calculator,**

(a) show that $\cos 75° = \dfrac{\sqrt{3}-1}{2\sqrt{2}}$. [2]

$$\cos 75° = \cos(30°+45°) = \cos 30° \cos 45° - \sin 30° \sin 45°$$
$$= \frac{\sqrt{3}}{2} \cdot \frac{1}{\sqrt{2}} - \frac{1}{2} \cdot \frac{1}{\sqrt{2}}$$
$$= \frac{\sqrt{3}-1}{2\sqrt{2}}$$

(b) express $\sec^2 75°$ in the form $a + b\sqrt{3}$, where a and b are integers. [5]

$$\sec^2 75° = \frac{1}{\cos^2 75°}$$
$$= \frac{1}{\left(\frac{\sqrt{3}-1}{2\sqrt{2}}\right)^2}$$
$$= \frac{8}{(\sqrt{3}-1)^2}$$
$$= \frac{8}{3-2\sqrt{3}+1}$$
$$= \frac{8}{4-2\sqrt{3}}$$
$$= \frac{8}{4-2\sqrt{3}} \cdot \frac{4+2\sqrt{3}}{4+2\sqrt{3}}$$
$$= \frac{32+16\sqrt{3}}{16-12}$$
$$= 8 + 4\sqrt{3}$$

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

9
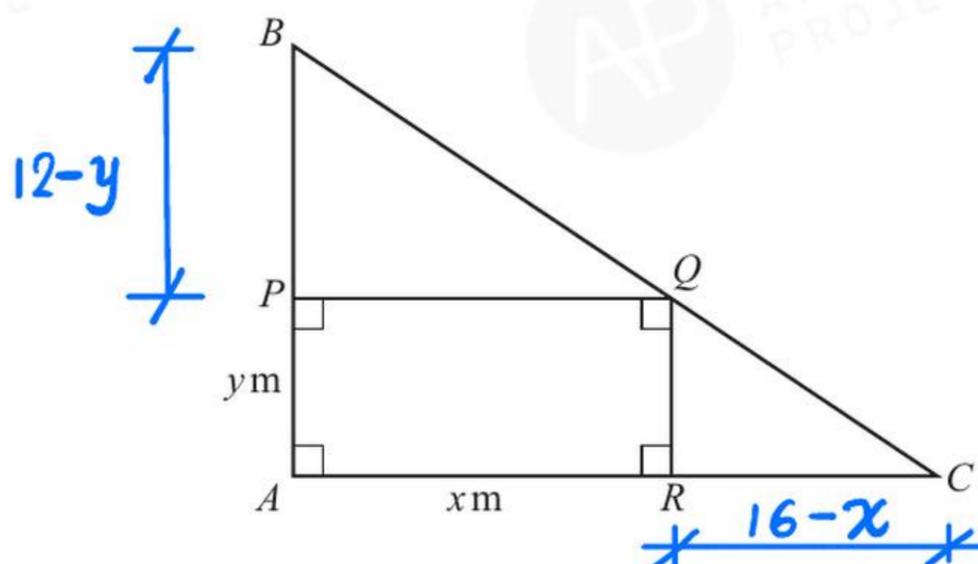

The diagram shows a triangular plot of ground, ABC, in which $AB = 12$ m, $AC = 16$ m and angle $BAC = 90°$. A gardener considers using a rectangular part, $APQR$, of the triangle, where P, Q and R lie on AB, BC and AC respectively, for growing vegetables.

(a) Given that the length of AR is x m and the length of AP is y m, show that $y = 12 - \dfrac{3x}{4}$. [3]

$$\underline{\text{By similar } \triangle s:} \quad \frac{RC}{AC} = \frac{QR}{BA}$$

$$\frac{16-x}{16} = \frac{y}{12}$$

$$192 - 12x = 16y$$

$$\underline{y = 12 - \tfrac{3}{4}x}$$

(b) Given that x can vary, find the largest possible area of the vegetable plot. [4]

$$A = yx = (12 - \tfrac{3}{4}x)x = 12x - \tfrac{3}{4}x^2$$

$$\frac{dA}{dx} = 12 - \tfrac{3}{2}x$$

$$\text{Let } 12 - \tfrac{3}{2}x = 0$$

$$\tfrac{3}{2}x = 12$$

$$x = 8$$

x	8^-	8	8^+
$\dfrac{dA}{dx}$	/	—	\

Using First derivative test, A is max. when $x = 8$ m.

$$\text{Hence, } A \text{ max.} = 12(8) - \tfrac{3}{4}(8^2)$$

$$= \underline{48 \text{ m}^2}.$$

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

10 The expression $2x^3 - x^2 + ax + b$, where a and b are constants, has a factor of $x - 2$ and leaves a remainder of 12 when divided by $x + 2$.

(a) Find the value of a and of b. [4]

$$\text{Let } f(x) = 2x^3 - x^2 + ax + b$$
$$f(2) = 16 - 4 + 2a + b = 0$$
$$b = -2a - 12 \quad ——①$$
$$f(-2) = -16 - 4 - 2a + b = 12$$
$$b = 2a + 32 \quad ——②$$
$$\therefore -2a - 12 = 2a + 32$$
$$4a = -44$$
$$\underline{a = -11} \quad \text{and} \quad \underline{b = 10}$$

(b) Using these values of a and b, solve the equation $2x^3 - x^2 + ax + b = 0$. [4]

$$
\begin{array}{r}
2x^2 + 3x - 5 \\
x - 2 \overline{\smash{\big)}\ 2x^3 - x^2 - 11x + 10} \\
-(2x^3 - 4x^2) \\
\hline
3x^2 - 11x + 10 \\
-(3x^2 - 6x) \\
\hline
-5x + 10 \\
-(-5x + 10) \\
\hline
0
\end{array}
$$

$$\therefore f(x) = (x-2)(2x^2 + 3x - 5)$$
$$= (x-2)(2x+5)(x-1)$$
$$\text{When } f(x) = 0, \quad \underline{x = -\tfrac{5}{2}, 1 \text{ or } 2}$$

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

11

In the diagram, A, B, C, D and E lie on a circle such that $AB = BC$ and BA is parallel to CE. The tangent to the circle at A meets CE produced at T. Angle $TAE = \theta$.

(a) Show that CA bisects angle BCE. [3]

$\angle ACE = \angle TAE = \theta$ (tangent - chord theorem)

$\angle BAC = \angle ACE = \theta$ ($BA /\!/ CE$, alt. $\angle s$)

$\angle BAC = \angle BCA = \theta$ ($AB = BC$, isos. $\triangle s$)

Since $\angle BCA = \angle ACE = \theta$,
  CA bisects $\angle BCE$ (shown).

(b) Show that angle $CDE = 3\theta$. [5]

$\angle SAB = \angle BCA = \theta$ (tangent - chord theorem)

$\therefore \angle CAE = 180° - \angle SAB - \angle BAC - \angle TAE$
      $= 180° - 3\theta$ ($\angle s$ on a str. line)

$\angle CDE = 180° - \angle CAE$
      $= 180° - (180° - 3\theta)$
      $= 3\theta$ (opp. $\angle s$ in a cyclic quad are
          supplementary).

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

12   **(a)**   Prove the identity $(\operatorname{cosec} x - \cot x)(\sec x + 1) = \tan x.$ [4]

$$LHS = \left(\frac{1}{\sin x} - \frac{\cos x}{\sin x}\right)\left(\frac{1}{\cos x} + \frac{\cos x}{\cos x}\right)$$

$$= \frac{(1 - \cos x)(1 + \cos x)}{\sin x \cos x}$$

$$= \frac{1 - \cos^2 x}{\sin x \cos x}$$

$$= \frac{\sin^2 x}{\sin x \cos x}$$

$$= \tan x$$

$$= RHS$$

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

4049/01/SP/21

(b) Hence solve the equation $(\operatorname{cosec} x - \cot x)(\sec x + 1) = 4\cot x$ for $0° < x < 180°$. [3]

$$\tan x = 4\cot x$$
$$\tan^2 x = 4$$
$$\tan x = \pm 2$$

Basic angle for $x = 63.435°$

x lies in all quadrants.

Hence $\underline{x = 63.4° \text{ or } 116.6°}$ since $0° < x < 180°$

(c) Show that there are no solutions to the equation $(\operatorname{cosec} x - \cot x)(\sec x + 1) = \tan 2x$
for $0° < x < 180°$. [2]

$$\tan x = \tan 2x$$
$$\tan x = \frac{2\tan x}{1 - \tan^2 x}$$
$$-\tan^3 x + \tan x - 2\tan x = 0$$
$$\tan^3 x + \tan x = 0$$
$$\tan x(1 + \tan^2 x) = 0$$
$$\tan x = 0 \quad \text{or} \quad \tan^2 x = -1$$

Basic angle for $x = 0°$

(No Solution as $\tan^2 x \geqslant 0$)

But since $0° < x < 180°$,
there are no solutions for x.

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

13 In a race, a cyclist passes a point A at the top of a hill with a speed of 5 m/s. He then increases his speed and passes the finishing post B, 10 seconds later, with a speed of 20 m/s. Between A to B, his velocity, v m/s, is given by $v = 0.1t^2 + pt + q$, where t is the time in seconds from passing A, and p and q are constants.

(a) Show that $q = 5$ and find the value of p.   [3]

given $v = 0.1t^2 + pt + q$

When $t = 0s$, $\underline{5 = q}$

When $t = 10s$, $20 = 0.1(10)^2 + p(10) + 5$

$10p = 5$

$p = \frac{1}{2}$

Hence, $v = 0.1t^2 + 0.5t + 5$

(b) Find the acceleration of the cyclist when his speed is 11.6 m/s.   [4]

$a = \dfrac{dv}{dt} = 0.2t + 0.5$

When $v = 11.6$ m/s, $11.6 = 0.1t^2 + 0.5t + 5$

$0.1t^2 + 0.5t - 6.6 = 0$

$t = -11$ or $\underline{6 s}$

(Rej.)

When $t = 6s$, $a = 0.2(6) + 0.5$

$= \underline{1.7 \ m/s^2}$

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.

(c) Find the distance *AB*. [3]

$$s = \int v \, dt$$
$$= \int 0.1t^2 + 0.5t + 5 \, dt$$
$$= \frac{0.1t^3}{3} + \frac{0.5t^2}{2} + 5t + C$$
$$= \frac{1}{30}t^3 + \frac{1}{4}t^2 + 5t + C$$

When $t = 0s$, $s = 0$
$$\therefore C = 0$$
$$\Rightarrow s = \frac{1}{30}t^3 + \frac{1}{4}t^2 + 5t$$

When $t = 10s$, $\quad s = \frac{1}{30}(10)^3 + \frac{1}{4}(10)^2 + 5(10)$
$$= 108\frac{1}{3} \text{ m}$$

The suggested solutions are prepared by Mr Alvin Yeo. Mr Yeo will hold no liability for any errors.
